

# IT-DUMPS Q&A

Accurate study guides, High passing rate!  
IT-dumps provides update free of charge in one year!

**Exam** : **070-340**

**Title** : Implementing Security for  
Applications with Microsoft  
Visual C# .NET

**Version** : DEMO

1. You are an application developer for your company. You are developing a Windows Forms application. You deploy a supporting assembly named MyAssembly.dll to the global assembly cache. During testing, you discover that the application is prevented from accessing MyAssembly.dll. You need to ensure that the application can access MyAssembly.dll. What should you do?

- A. Digitally sign the application by using a digital certificate.
- B. Run the `caspol.exe -s` on command from the command line.
- C. Run the Assembly Linker to link MyAssembly.dll to the application.
- D. Modify the security policy to grant the application the FullTrust permission.

Answer: D

2. You are an application developer for your company. You develop an application that uses an external class library. You run the Permissions View tool on the class library and receive the following output: Microsoft (R) .NET Framework Permission Request Viewer. Version 1.1.4322.573 Copyright (C) Microsoft Corporation 1998-2002. All rights reserved. minimal permission set: `<PermissionSet class="System.Security.PermissionSet" version="1"><IPermission class="System.Security.Permissions.ReflectionPermission, mscorlib, Version=1.0.5000.0, Culture=neutral, PublicKeyToken=b77a5c561934e089" version="1" Flags="ReflectionEmit"/><IPermission class="System.Security.Permissions.SecurityPermission, mscorlib, Version=1.0.5000.0, Culture=neutral, PublicKeyToken=b77a5c561934e089" version="1" Flags="SerializationFormatter"/></PermissionSet>` optional permission set: `<PermissionSet class="System.Security.PermissionSet" version="1" Unrestricted="true"/>` refused permission set: Not specified You need to add corresponding attributes in your application. Which code segment should you use?

- A. `[assembly: ReflectionPermission(SecurityAction.RequestRefuse, ReflectionEmit=false)]`  
`[assembly: SecurityPermission(SecurityAction.RequestRefuse, SerializationFormatter=false)]` `[assembly: PermissionSetAttribute(SecurityAction.RequestOptional, Unrestricted=true)]`
- B. `[assembly: ReflectionPermission(SecurityAction.RequestMinimum, ReflectionEmit=false)]` `[assembly: SecurityPermission(SecurityAction.RequestRefuse, SerializationFormatter=false)]` `[assembly: PermissionSetAttribute(SecurityAction.RequestRefuse, Unrestricted=true)]`
- C. `[assembly: ReflectionPermission(SecurityAction.RequestMinimum, ReflectionEmit=false)]` `[assembly: SecurityPermission(SecurityAction.RequestMinimum, SerializationFormatter=false)]` `[assembly: PermissionSetAttribute(SecurityAction.RequestOptional, Unrestricted=true)]`
- D. `[assembly: ReflectionPermission(SecurityAction.RequestMinimum, ReflectionEmit=true)]` `[assembly: SecurityPermission(SecurityAction.RequestMinimum, SerializationFormatter=true)]` `[assembly: PermissionSetAttribute(SecurityAction.RequestOptional, Unrestricted=true)]`

Answer: D

3. You are an application developer for your company. You create a Web application that is used by all users in the company. The application is hosted on the intranet Web server, which is named WebServer. WebServer has IIS 5.0 installed. The Web application is configured to use Integrated Windows authentication. The Web.config file specifies that the authentication mode is set to Windows. The application connects to a Microsoft SQL Server database named DataStore. The database is located on WebServer. The SQL Server computer is configured with SQL Server logins disabled. The database connection code is shown in the following code segment.

```
string myConnStr; myConnStr = @"Initial Catalog=""DataStore"";"; myConnStr = myConnStr + "Data Source=localhost;Integrated Security=SSPI;"; SqlConnection myConn = new SqlConnection(myConnStr); string myInsert; myInsert = "INSERT INTO Customer (CustomerID, Name) Values('123', 'John Doe')"; SqlCommand myCmd = new SqlCommand(myInsert);
```

```
myCmd.Connection = myConn; myConn.Open(); myCmd.ExecuteNonQuery();
```

```
myCmd.Connection.Close();
```

When you run the application by using Microsoft Internet Explorer, you receive an error message that reads in part: "Login failed for user WebServer\ASPNET." You need to ensure that the application can run successfully without prompting the user for a user name and password. What should you do?

- A. Change the authentication mode in IIS to basic authentication. Update the connection string.
- B. Change the authentication mode in IIS to Anonymous and supply a login ID and password for a SQL Server login account that has access to the database. Update the connection string.
- C. Enable Integrated Windows authentication in Internet Explorer.
- D. Enable impersonation in the Web.config file.

Answer: D

4. You are an application developer for your company. You create a serviced component named RecordsAdmin. RecordsAdmin exposes administrative methods for a records management application. The declaration for RecordsAdmin includes the following code segment.

```
[assembly: ApplicationAccessControl(true)] [ComponentAccessControl(true), SecurityRole("Admin")] public class RecordsAdmin : ServicedComponent { }
```

You install RecordsAdmin on a test computer. You use a test application that runs on the test computer under a local computer account named Tester. The Tester account is a member of the Users group and the Debugger Users group. When the test application calls RecordsAdmin, you receive the following error message: "Access is denied." You want the test application to have access to RecordsAdmin. You want to achieve this goal without granting unnecessary permissions to the Tester account. What should you do?

- A. Add the Tester account to the local Administrators group.
- B. Add the Tester account to the Admin role of RecordsAdmin by using the Component Services tool.
- C. Add a role named TesterRole to RecordsAdmin. Add the Tester account to the TesterRole role by using the

Component Services tool.

D. To the beginning of each method exposed by RecordsAdmin, add the following code segment. if (ContextUtil.IsCallerInRole("Admin")) { // Method body here }

E. To the beginning of each method exposed by RecordsAdmin, add the following code segment. SecurityCallContext context; context = SecurityCallContext.CurrentCall; if (context.IsUserInRole("Admin", "Tester")) {

// Method body here }

Answer: C

5. You are an application developer for your company. You are developing a forms-based application that reads files that are named by users of the application. The application contains the following method. bool approveFileName(string fileName) { string docRoot=@"C:\MyApp\Documents\"; // Your code goes here... Throw an exception if you meet an error.

return true; } Users of the application must not be allowed to access files that are stored in any location other than the C:\MyApp\Documents folder. You need to add code to the method to achieve this goal. Which code segment or code segments should you use? (Choose all that apply.)

A. fileName=Path.GetFullPath(fileName);

B. fileName=fileName.ToUpper();

C. fileName=fileName.ToLower();

D. docRoot=docRoot.ToLower();

E. fileName=docRoot+fileName;

F. if (!fileName.StartsWith(docRoot))

throw new ApplicationException ( "User asked for file in wrong directory");

Answer: ACDF

6. You are an application developer for your company. You develop a Windows Forms application that connects to a local Microsoft SQL Server database by using the Microsoft .NET Framework Data Provider for SQL Server. The application currently connects to the database by using an account that is a member of the System Administrator role in SQL Server. You need to ensure that the application can connect to the database by using the user account of the interactive user without providing additional permissions. What should you do?

A. Modify the application to activate a SQL Server application role.

B. Modify the application to use SQL Server integrated security.

C. Modify the application to send a security token that contains the authentication information in a Kerberos ticket.

D. Modify the application to use COM+ security roles.

Answer: B

7. You are an application developer for your company. Part of an application that you are developing accepts user input from a TextBox control. The information entered by the user must be alphanumeric only, and it must contain no symbols or punctuation. You need to ensure that the user's input contains only the appropriate data before using the input elsewhere in the application. Your solution must not require users of the application to take additional steps when entering data. What should you do?

A. Modify the TextChanged event handler of the TextBox control so that the Text property of the text box is cleared whenever a non-alphanumeric character is detected.

B. Use the following regular expression to modify the user's input.

`[^\w\.\@-]`

C. Store the user's input in a variable named userInput. Use the following expression to modify the user's input. `userInput.Replace("@-", "")`

D. Convert the user's input to all lowercase characters.

Answer: B

8. You are an application developer for your company. You are developing a Windows-based payroll application that will be used by all payroll administrators in the company. The application has a single executable file that uses a separate

assembly to modify payroll data. You need to design security for your application to ensure that the assembly cannot be called by unauthenticated and unauthorized users. What should you do?

A. Run the application by using a user account that has access to the application directory.

B. Modify the application to validate all user-entered data.

C. Modify the application to authenticate and authorize user access within each assembly as it is called.

D. Modify the application to authenticate and authorize user access when each user runs the executable file.

E. Set the folder-level permissions to the executable file by using directory security

Answer: C

9. You are an application developer for your company. You are developing an application that will be used in the human resources departments of companies that purchase the application. The application includes administrative features that enable users to access and modify confidential information that the application

manages. Usability testing indicates that customers deploy the application without properly restricting administrative features. You need to ensure that the application is more secure when it is deployed. What should you do?

- A. Develop sample template configuration files for the application.
- B. Configure the default installation of the application to disable all the administrative features.
- C. Develop two editions of the application that have the administrative features enabled by default in one edition and disabled by default in the other edition.
- D. Create a Readme.doc file that describes the risks of leaving the administrative features enabled and provides instructions for disabling the features.

Answer: B

10. You are an application developer for your company. You are using the Microsoft .NET Framework to develop an application that uses a Web service. The Web service is provided by a vendor and is accessed over the Internet. Your application retrieves string data from the Web service and stores it in a variable named `webdata`. The application also defines a `SqlCommand` object named `sqlcmd`. The application contains the following code segment.

```
string myquery; myquery = "INSERT INTO WebTable (WebData) VALUES(";
```

`myquery += webdata + ")"; sqlcmd.CommandText = myquery; sqlcmd.ExecuteNonQuery()` You need to improve the security of this code segment while maintaining its functionality. What should you do?

- A. Ask the vendor to perform data validation on all data that is provided by the Web service.
- B. Modify the application to use declarative security.
- C. Ask the vendor to provide a Web service that is written by using the .NET Framework.
- D. Format the contents of `webdata` to be compatible with the SQL Server data type and remove encoded data or SQL statements.

Answer: D
