Exam : 070-445

**Title : TS:MS SQL Server 2005
Business
Intelligence-Implem &
Mainte**

Version : DEMO

1.You are designing a Microsoft SQL Server 2005 Integration Services (SSIS) package. The package has the following features: Two Data Flow tasks and two Control Flow tasks A success constraint between each Data Flow task and the subsequent Control Flow task The package uses one transaction for all the tasks. You need to configure the package so that the two Data Flow tasks use their own transactions. You also need to ensure that each Control Flow task is enlisted in the same transaction as its preceding Data Flow task. Which three actions should you perform? (Each correct answer presents part of the solution. Choose three.)

- A.Change the TransactionOption property to Supported for the package.
- B.Change the TransactionOption property to Required for the package.
- C.Change the TransactionOption property to Supported for each Data Flow task.
- D.Change the TransactionOption property to Required for each Data Flow task.
- E.Change the TransactionOption property to Supported for each Control Flow task.
- F.Change the TransactionOption property to Required for each Control Flow task.

Correct:A D E

2.You are designing a Microsoft SQL Server 2005 Integration Services (SSIS) package. The package contains 30 Data Flow tasks and 30 Control Flow tasks. The package runs slower than expected. You need to capture the start time, the finish time, and the elapsed time for the validation and execution of the package. What should you do?

- A.Enable the OnProgress event handler and use the Control Flow tasks to write the information to a log.
- B.Monitor the Progress tab during the execution of the package, and then monitor the Execution Results tab.
- C.Use the Performance Monitor tool to capture the counters from the SQL Server: SSIS Service object. Analyze the output for the required information.
- D.Use the Performance Monitor tool to capture the counters from the SQL Server: SSIS Pipeline object. Analyze the output for the required information.

Correct:B

3.Microsoft SQL Server Management Studio (SSMS) is installed on your workstation. Microsoft Business Intelligence Development Studio (BIDS) is not installed on your workstation. You need to create a package that must meet the following requirements: It must be transactional. It must be optimized for 20 tables. It must be stored securely in the msdb database of a remote server. What should you do?

- A.Create the package by using DTS Designer.
- B.Create the package by using the Package Migration Wizard.
- C.Create the package by using the Microsoft SQL Server Import and Export Wizard.
- D.On the Microsoft SQL Server 2005 Integration Services (SSIS) menu, click the Create Package submenu.

Correct:C

4.You are designing a Microsoft SQL Server 2005 Integration Services (SSIS) package. While testing, a Transact-SQL user-defined function causes duplicate key values that stop the transformation. To permit the transformation to continue, the package must perform the following tasks: 1. Ascertain which rows are affected. 2. Insert the rows that fail into a table. 3. Continue with the process. You need to change certain properties in the package to meet the requirements. Which three tasks should you perform? (Each correct answer presents part of the solution. Choose three.)

- A.Choose the Redirect Row option for the Error property on the key column.
- B.Choose the Ignore Failure option for the Error property on the key column.
- C.Choose the Fail Component option for the Error property on the key column.
- D.Add a DataReader source to use a new Data Flow destination when the Failure constraint is fired.
- E.Add a DataReader source to use a new Data Flow destination when the Completion constraint is fired.
- F.Edit the Error Output properties for each DataReader source and configure each data source for error handling.

Correct:A D F

5.You are designing a Microsoft SQL Server 2005 Integration Services (SSIS) package. The package uses at least one sequence container in one transaction. Each transaction controls a Data Flow task and a Control Flow task. Each Data Flow task has a Success constraint. The Control Flow task follows the Success constraint. The package must include the following requirements: Each Data Flow task must use its own transaction. The Control Flow task and the Data Flow task that precedes it must succeed or fail as an atomic unit. A restart point must restart each Data Flow task and the Control Flow task that follows it as an atomic unit. You need to make changes in the control flow designer to meet the outlined requirements. Which two actions should you perform? (Each correct answer presents part of the solution. Choose two.)

- A.Add all the Data Flow tasks and the Control Flow tasks to one sequence container.
- B.Add a sequence container for each Control Flow task and the Data Flow task that precedes it.
- C.Change the FailPackageonFailure property to true for each new sequence container that is added to the package.
- D.Change the FailPackageonFailure property to false for each new sequence container that is added to the package.

Correct:B C

6.You are designing a Microsoft SQL Server 2005 Integration Services (SSIS) package. An Analysis Services Processing task in the package requires data from a file. The file is exported to a file share. If the file is not available on the file share, the Analysis Services Processing task must import data from a remote Microsoft SQL Server 2005. You need to add steps to the package to import the data. What should you do? (To answer, move the appropriate steps from the list of steps to the answer area and arrange them in the correct order.)

The screenshot shows the SSIS Control Flow Designer interface. On the left, there is a list of steps to be arranged in a sequence container. The steps are:

- Set the **FailPackageOnFailure** property to **false**.
- Set the **FailPackageOnFailure** property to **true**.
- Add a Failure constraint between the File System task and a new Data Flow task that executes a query.
- Add a Completion constraint between the File System task and a new Data Flow task that executes a query.
- Add a Failure constraint between the File System task and the existing Analysis Services Processing task.
- Add a new Analysis Services Processing task and connect it to the new Data Flow task.

On the right, there is a large empty area representing the sequence container where these steps can be dropped and arranged in the correct order. Navigation arrows are visible on the right side of the container.

Correct:

Green choice1---->Yellow Choice1

Green choice3---->Yellow Choice2

Green choice6---->Yellow Choice3

7.You are designing a Microsoft SQL Server 2005 Integration Services (SSIS) package. The OLE DB data source for the package is a database that is updated frequently. You need to create a package that accomplishes the following tasks: Implement the IRowsetFastLoad interface. Support various data flow destinations. Which two actions should you perform? (Each correct answer presents part of the solution. Choose two.)

- A.Use an OLE DB data flow destination.
- B.Use a Recordset data flow destination.
- C.Use a DataReader data flow destination.
- D.Create separate data flow destinations within the same Data Flow task.

Correct:A D

8.Your company's business intelligence (BI) model uses Microsoft SQL Server 2005 Integration Services (SSIS). There are 20 packages that use the same configuration. The package configuration is stored in an XML file as a variable. You need to track the changes that affect a package that uses one variable. You also need to modify the package to provide automatic notification by e-mail whenever there are changes to the variable. What should you do? (To answer, move the appropriate steps from the list of steps to the answer area and arrange them in the correct order.)

The screenshot shows the 'Package Configuration' window in SQL Server Data Tools. On the left, there is a list of steps to be arranged in the correct order. The steps are:

- Create an **OnPreExecute** event handler.
- Create an **OnPreValidate** event handler.
- Create an **OnVariableValueChanged** event handler.
- Add a Send Mail task to the appropriate event handler.
- Set the **RaiseChangeEvent** property for the variable to **true**.
- Set the **RaiseChangeEvent** property for the variable to **false**.

On the right, there is an empty area for the answer, with up and down arrows on the right side to rearrange the steps.

Correct:

Green choice5---->Yellow Choice1

Green choice3---->Yellow Choice2

Green choice4---->Yellow Choice3

9.You are designing a Microsoft SQL Server 2005 Integration Services (SSIS) package. The package contains a single OLE DB data source. The package must be deployed on 10 servers. The package uses the XML configuration file to connect to a pre-assigned server. You need to ensure that the package uses the correct server at runtime. What should you do? (To answer, move the appropriate steps from the list of steps to the answer area and arrange them in the correct order.)

Correct:

Green choice4---->Yellow Choice1

Green choice2---->Yellow Choice2

Green choice6---->Yellow Choice3

10.You are designing a Microsoft SQL Server 2005 Integration Services (SSIS) package. The package is named UpdateTable.dtsx and contains a variable named runID. The package must run by using the dtexec utility. The runID variable must be set at runtime to a value of 5. You need to meet the outlined requirements. What should you do?

- A.Execute dtexec /F "c:\ssisPackages\UpdateTable.dtsx" /SET \packages.variables[runID].Value;5.
- B.Execute dtexec /F "c:\ssisPackages\UpdateTable.dtsx" /SET \packages.variables.runID=5.
- C.Create a text file that specifies the variable name and value in the format package.variables[runID].Value = 5. Execute dtexec /F "c:\ssisPackages\UpdateTable.dtsx" /COM where is the name of the file you just created.
- D.Create a text file that specifies the variable name and value in the format runID=5. Execute dtexec /F "c:\ssisPackages\UpdateTable.dtsx" /COM where is the name of the text file you just created.

Correct:A

11.You create 25 Microsoft SQL Server 2005 Integration Services (SSIS) packages on the development server. You decide to deploy the SSIS packages on the test server. You need to create a repeatable process that will allow you to deploy the packages to the package store on the test server if the packages change. You also need to ensure that this is achieved with minimum effort. What should you do?

- A.Use Microsoft SQL Server Business Intelligence Development Studio (BIDS) to save each package to the remote server.
- B.Use the dtutil utility in a batch file to deploy each of the package .dtsx files to the remote server with the /Fi option.
- C.Copy the Microsoft SQL Server Business Intelligence Development Studio (BIDS) files to the remote server and build the SSIS project on the remote server.
- D.Create a package deployment utility in Microsoft SQL Server Business Intelligence Development Studio (BIDS) and use the Deployment Wizard to deploy all the packages.

Correct:D

12.You are designing a Microsoft SQL Server 2005 Integration Services (SSIS) package. You need

to ensure that the package came from a trusted source. What should you do?

- A.Change the CheckSignatureOnLoad property of the package to false.
- B.Change the CheckSignatureOnLoad property of the package to true.
- C.Create a certificate. Change the CheckSignatureOnLoad property of the package to false.
- D.Create a certificate. Change the CheckSignatureOnLoad property of the package to true.

Correct:D

13.You are designing a Microsoft SQL Server 2005 Integration Services (SSIS) package. You create a table and populate the table with the required data. You receive an error message "destination table not found" when you run the package without the package destination objects. You need to set a package property that runs the package without giving the "destination table not found" error message when the configuration setting of the Connection Manager fails. Which package property should you set?

- A.DelayValidation = true
- B.MaximumErrorCount = 2
- C.DisableEventHandler = true
- D.FailPackageOnFailure = false

Correct:A

14.You are designing a Microsoft SQL Server 2005 Integration Services (SSIS) package. The package is connected to a database on your development server by using a connection manager. You decide to use the DTEXECUI utility to run the package. You need to change the connection of the connection manager to a different server at run time without using a package configuration file. What should you do?

- A.Specify an appropriate command file by using the Command Files dialog box.
- B.Specify an appropriate Connection String variable in the Set Values dialog box.
- C.Specify an appropriate package configuration by using the Configurations dialog box.
- D.Specify a different connection string for the connection manager by using the Connection Manager dialog box.

Correct:D

15.You are designing a Microsoft SQL Server 2005 Reporting Services (SSRS) accounting report. Every other line of output in the report table must have a green background. You need to use the appropriate expression for the BackgroundColor property of the table. Which expression should you use?

- A.=Iif((RowNumber("Odd")), "Green", "White")
- B.=Iif((RowNumber(Nothing)), "Green", "White")
- C.=Iif((RowNumber(Nothing) MOD 2), "Green", "White")
- D.=Iif((RowNumber(InScope("Odd"))), "Green", "White")

Correct:C

16.You are designing a Microsoft SQL Server 2005 Reporting Services (SSRS) report. The report must use a custom assembly to perform real-time lookup and currency conversion. The assembly has a static class named CurrencyConversion that exists in the namespace FinancialCalc. The class has a method named ToEUR that requires two arguments, Currency and CurrencyCode. You need to reference the ToEUR method in an expression to convert USD to EURO when the report runs. Which expression should you use?

- A.=Code.FinancialCalc.CurrencyConversion.ToEUR (Fields!Currency.Value, "USD")

B.=Code!FinancialCalc.CurrencyConversion.ToEUR (Fields!Currency.Value,"USD")

C.=FinancialCalc.CurrencyConversion.ToEUR (Fields!Currency.Value,"USD")

D.=FinancialCalc!CurrencyConversion.ToEUR (Fields!Currency.Value,"USD")

Correct:C

17.You are designing a Microsoft SQL Server 2005 Reporting Services (SSRS) report model. Users must develop their own SSRS reports by using your report model in the Report Builder tool. The data source for the report model is a Microsoft SQL Server 2000 database that contains 900 tables and 700 views. You need to build a report model that allows users access to only the 10 tables that they require for reporting. What should you do?

A.Select the Create roles rule when you generate the report model.

B.Create a data source view and select the Restrict to Schema(s) option.

C.Create a data source view and select only the required tables and views.

D.Clear the Create entities for all tables rule when you generate the report model.

Correct:C

18.You are designing a Microsoft SQL Server 2005 Reporting Services (SSRS) report. You notice that while printing a report, blank pages are printed after every page that contains the data. But the report appears correctly when you view it on screen. You need to ensure that the blank pages are not printed. Which report property should you use?

A.Page Size

B.Grid Spacing

C.Interactive Size

D.DataTransform

Correct:A

19.You are designing a Microsoft SQL Server 2005 Reporting Services (SSRS) report. You create a report parameter named DisplayCol that contains the following properties: Data Type: Integer Prompt: Display Column Available Values: Non-queried with the following Label/Value pairs: oYes/1 oNo/0 Default Values: Null The report parameter is used to control the visibility of the column. You need to use the appropriate expression in the Hidden property for the column. Which expression should you use?

A."=Parameters!DisplayCol.Value"

B."=Parameters!rc:DisplayCol.Value"

C."=Iif(Parameters!DisplayCol.Value=1,False,True)"

D."=Iif(Parameters!rc:DisplayCol.Value=1,False,True)"

Correct:C

20.You are designing a Microsoft SQL Server 2005 Reporting Services (SSRS) report. The report is based on the multidimensional data from a Microsoft SQL Server 2005 Analysis Services (SSAS) cube. You need to use the Report Wizard to create a Matrix report by using the [Change Count] measure in the Details field. Which Multidimensional Expressions (MDX) query should you use?

A.SELECT NON EMPTY { [Measures].[Change Count] } ON ROWS, DIMENSION PROPERTIES MEMBER_CAPTION { [Measures].[Change Count] } ON COLUMNS

B.SELECT NON EMPTY { [Measures].[Change Count] } ON COLUMNS, DIMENSION PROPERTIES MEMBER_CAPTION { [Measures].[Change Count] } ON ROWS

C.SELECT DIMENSION PROPERTIES MEMBER_CAPTION { [Measures].[Change Count] } ON ROWS

D.SELECT DIMENSION PROPERTIES MEMBER_CAPTION { [Measures].[Change Count] } ON

COLUMNS

Correct: B
