13. An SQL procedure has been developed with several inline SQL PL statements encapsulated in a dynamic compound SQL statement. The procedure had been tested and performed well. After making a change to the last SQL statement the procedure not only failed to complete, but did not produce output from any statements which were not modified. Answer: C

15. Table EMPLOYEE contains the following rows: EMPNO FIRSTNME LASTNAME WORKDEPT

000010 CHRISTINE HAAS A00 000020 MICHAEL THOMPSON B01 000030 SALLY KWAN C01  
The isolation level for Application 1 is set to CS and autocommit is disabled. The isolation level for Application 2 is set to CS and the autocommit is enabled. The following statements are executed in sequence:

Application 1:

DECLARE c1 CURSOR FOR SELECT \* FROM employee ORDER BY empno OPEN C1 FETCH C1  
FETCH C1 Application 2:

UPDATE employee SET lastname = 'MILLFORD' WHERE empno = '000020' Which of the following statements is correct?

- A. The UPDATE succeeds because Application 2 runs with autocommit enabled so no row level locks are necessary for the update.

- C. The UPDATE fails because Application 1 holds a row level read lock that is in conflict with the lock required by Application 2.C.
- D. The UPDATE fails because the row level locks held by Application 1 have been escalated to table lock so updates by other connections are disallowed.
